### Colour Legend

<span style="background-color: #90EE90; border: 1px solid black; padding: 2px;"></span>	No clinically significant interaction expected.
<span style="background-color: #FF0000; border: 1px solid black; padding: 2px;"></span>	These drugs should not be coadministered.
<span style="background-color: #FFB64D; border: 1px solid black; padding: 2px;"></span>	Potential interaction which may require a dose adjustment or close monitoring.
<span style="background-color: #FFFF00; border: 1px solid black; padding: 2px;"></span>	Potential interaction predicted to be of weak intensity. No <i>a priori</i> dosage adjustment is recommended.

### Text Legend

- ↑ Potential increased exposure of the antihypertensive
- ↓ Potential decreased exposure of the antihypertensive
- ↔ No significant effect
- ▼ One or both drugs may cause QT and/or PR prolongation.  
ECG monitoring is advised if coadministered with atazanavir or lopinavir; caution is advised with rilpivirine as supratherapeutic doses of rilpivirine (75 and 300 mg once daily) were shown to prolong the QT interval.
- Numbers refer to increase or decrease in AUC as observed in drug-drug interaction studies.

### Notes

- a Concentrations of parent drug decreased but concentrations of active metabolite increased.
- b Concentrations of parent drug increased but concentrations of active metabolite decreased.
- c Concentrations of lamivudine and/or atenolol may increase due to competition for renal transport proteins; no interaction is expected with emtricitabine.
- d Coadministration may increase bictegravir concentrations; no effect on emtricitabine or tenofovir alafenamide is expected.
- e Coadministration may increase bictegravir and tenofovir alafenamide concentrations; no effect on emtricitabine is expected.
- f Coadministration may increase tenofovir alafenamide concentrations; no effect on emtricitabine is expected.
- g Concentrations of lamivudine and/or amiloride may increase due to competition for renal transport proteins; no interaction is expected with emtricitabine.

Note: although some drug interactions are predicted to potentially require a dosage adjustment based on the drug's metabolic pathway, clinical experience with a particular antihypertensive and HIV drug may indicate that dosage adjustments are not an *a priori* requirement.
